Everything running in this environment is built from Java platform classes and interfaces. But Java ME is not without limitations. For example, it is not allowed to use classes from the Java Standard Edition (Java SE) directly. We have to create a bridge to enable this. This limitation is mentioned in the [Installing and running the Samples](Installing-and-running-the-samples.md) section in the **Installing Samples** topic. This is the reason why we have created a **Java SE-to-Java ME Bridge** application. We used this application to enable communication between the two different languages. We will start with a detailed explanation of this application and then proceed with the **DemoME2Java** application. The [**Java SE-to-Java ME Bridge**](is an application that connects the Java SE classes to the Java ME classes. ![Java SE-to-Java ME Bridge application](/archived/id_1565786525/image_4) The [**DemoME2Java**](application connects the Java ME classes to Java SE classes. It shows how you can use the [**Java SE-to-Java ME Bridge**](application to use the **Classes** and **Interfaces** from the Java SE directly. The name of the application indicates what it is intended to do. The name comes from the **DemoME2Java** **.** The name is **DemoME2Java** because the application connects the Java ME classes to the Java SE classes. ![DemoME2Java application](/archived/id_1565786525/image_5) The [**DemoME2Java**](application makes use of the [**Java SE-to-Java ME Bridge**](82157476af
